

Advanced software concepts for employing microcomputers in the laboratory

Scott B. Tilden and M. Bonner Denton,

Department of Chemistry, University of Arkansas, Fayetteville, Arkansas 72721, USA

Introduction

While a proliferation of commercial chemical instrumentation is appearing (and data integrating microprocessors for a variety of control and data reduction applications), the great potential of microprocessors has not been exploited collectively for individual users' applications. The primary reason for this phenomenon is altogether too clear: software development software is either difficult to develop or inefficient in necessary requirements and speed. This problem is even more important in situations requiring non-cost software

conditions. Initially, most instrument manufacturers utilized cross assemblies supported on large "mainframe computers" in order to overcome the required machine code output process. More recently, the trend has been toward the use of a "development system" (a cost comparable to a standard microprocessor) that allows one to use "high" level control in "high" efficiency because of the ever increasing overlap in computing capability in both low value assembly level programs which are subsequently converted to binary and incorporated into an instrument in the form of "read only memory" (ROMs). While this approach
