## **Organizational Genetics:**

Organizational Genetics Anthony Fedanzo Ph.D, 2001-03-29 The great insight of biological science in the last half of the 20th century is that life is a special kind of information. It is the information contained in the genetic program of each organism. Evolution is a continual process shaping the contents of the genetic program of countless species throughout the history of life on this planet. That process itself is now known to be essentially one of information processing. Viewing evolution as a kind of information processing opens the possibility that the laws of evolution operate to shape other kinds of information processing in systems other than those of organisms and their genetic programs. Business and industry as well as public agencies are the largest users of information processing technologies. If evolutionary processes are discoverable outside of strictly biological contexts it is reasonable to suppose that they will be found among those systems that use information processing nearly as much if not more than does Nature. Indeed the thesis of this work is that natural selection does operate over organizations that use so called Fourth Generation computerized database technologies. There are some basic conceptual hurdles that must be cleared before the vantage point of looking at evolutionary processes as information processes will reveal anything more than tantalizing analogies. The first hurdle is that compartmentalized thinking putting the things of this world into pigeonholes must be set aside in favor of a systems approach. By systems approach nothing more complex is meant than being self conscious about when and why it is sometimes convenient to compartmentalize thoughts, things and perceptions. It also means looking first at systems at the organized complexity that constitutes not only life but virtually all of humankind's activity and physical reality. Using a systems approach both organisms and organizations can be discussed from a common ground. The justification for adopting this outlook will appear more and more obvious as it is used to develop fruitful insights. A second conceptual hurdle that needs to be cleared is the frequent habit of thinking about information as some kind of passive stuff that gets manipulated, massaged, stored and retrieved by computers. In the world of computer technology and business the phrase data processing is the traditional reference for all forms of information processing and technology. Note that at any given time other phrases such as MIS, management information systems or IT information technology are more or less synonymous with data processing. For our purposes the latter phrase suffices. Unfortunately this phrase tends to solidify the mental habit of regarding information as a passive substance that people and machines manipulate as they see fit or are directed. In reality information has both a passive and an active role in systems. It is passive when we speak of communicating some particular item to another system, be it a person, machine or organization. Information is active when it takes the form of a program, plan or goal. This includes all the important meanings of what information means as well. Thus the second habit of thought to be put aside here is the belief that information is only acted upon. In fact information in the human mind and in organizations is usually present just for the active role of shaping and directing their behavior. A third conceptual hurdle is the assumption that any attempt to generalize a law of biology is simply

transplanting biology outside its proper domain and therefore is predestined to failure In this work biological laws especially those of evolution will be sought in the context of human organizations However they will not be transplanted there any more than a physical law of force mass and acceleration is transplanted to outer space when we discover that it desc

Colarelli, Richard D. Arvey, 2015-01-02 When biological theories were used to understand behavior in the early 20th century they were often poorly understood Ideas about race ethnicity and IQ and notions of social Darwinism were based on a misunderstanding and an incomplete understanding of genetics and Darwin s theory of evolution by natural selection Now however a biological understanding of social behavior is an integral part of modern science and increasingly used in the study of behavior in organizations Yet compared with other explanatory paradigms in organizational behavior biological and evolutionary approaches are still relatively rare *The Biological Foundations of Organizational Behavior* provides accessible insights for scholars and practitioners in management and organizational behavior into what biology can offer their fields Chapters contain enough background to orient readers who may have little knowledge of biology and provide substantive contributions to advancing understanding of specific areas of biology and human behavior in organizations They also show how the addition of biological theory and research to organizational behavior scholarship will increase its explanatory and predictive power and contribute to its scientific foundations **Genetics and Organizational Behavior** Richard D. Arvey, Wen-Dong Li, Nan Wang, 2016 Articles on the genetics of complex human behaviors and psychological traits provided in past volumes of journals published by Annual Reviews tended to adopt a pathological perspective and focused heavily on the disorders of human affect and behaviors In our review we expand our focus to the more general nonclinical population and in particular on the advances in the understanding of the genetics of attitudes and behaviors in work settings We review the recent and emerging literature using a behavioral genetics approach to examine the influence of genetics on a wide array of important constructs in organizational

behavior OB research and provide unique theoretical insights offered by this approach We discuss practical implications and future research directions from a broad person environment interactionist perspective by taking a genetics approach
