Quantization and Infinite-Dimensional Systems S.T. Ali, J-P Antoine, W. Lisiecki, I.M. Mladenov, A. Odziejewicz, 2013-03-09
As all participants know by now the Bialowieza Summer Workshop has acquired a life of its own. The charming venue of the meetings, the informal atmosphere, the enthusiasm of the participants and the intensity of the scientific interaction have all conspired to make these meetings wonderful learning experiences. The XIIth Workshop held from July 1-7, 1993 was once again a topical meeting within the general area of Differential Geometric Methods in Physics, focusing specifically on Quantization and Infinite dimensional Systems. Altogether about fifty participants attended the workshop. As before, the aim of the workshop was to have a small number of in depth lectures on the main theme and a somewhat larger number of short presentations on related areas while leaving enough free time for private discussions and exchange of ideas. Topics treated in the workshop included field theory, geometric quantization and symplectic geometry, coherent states, methods of holomorphic representation theory, Poisson structures, non commutative geometry, supersymmetry and quantum groups. The editors have the pleasant task of first thanking all the local organizers, in particular Dr K Gilewicz for their painstaking efforts in ensuring the smooth running of the meeting and for organizing a delightful array of social events. Secondly, they would like to record their indebtedness to all the people who have contributed to this volume and to the redoubtable Ms Cindy Parkinson without whose patient typesetting and editing skills the volume could hardly have seen the light of the day. Six years ago, in June 1977, the first international conference on chaos in classical dynamical systems took place here in Como. For the first time, physicists, mathematicians, biologists, chemists, economists and others got together to discuss the relevance of the recent progress in nonlinear classical dynamics for their own research field. Immediately after publication of *Nonlinear*

Science Abstracts started which in turn led to the Physica D Journal and to a rapid increase of the research activity in the whole area with the creation of numerous Nonlinear Centers around the world During these years great progress has been made in understanding the qualitative behavior of classical dynamical systems and now we can appreciate the beautiful complexity and variety of their motion Meanwhile an increasing number of scientists began to wonder whether and how such beautiful structures would persist in quantum motion Indeed mainly integrable systems have been previously considered by Quantum Mechanics and therefore the problem is open how to describe the qualitative behavior of systems whose classical limit is non integrable The present meeting was organized in view of the fact that scientists working in different fields mathematicians theoretical physicists solid state physicists nuclear physicists chemists and others had common problems Moreover we felt that it was necessary to clarify some fundamental questions concerning the logical basis for the discussion including the very definition of chaos in Quantum Mechanics

XXVI International Workshop on Geometrical Methods in Physics Piotr Kielanowski, Anatol Odziejewicz, Martin Schlichenmeier, 2007-11-26 This set of peer reviewed papers has come from the XXVIth International Workshop on Geometrical Methods in Physics and will be of huge interest to researchers The workshop covered a range of mathematical problems related to the description of quantum physical systems as well as to classical ones Physicists will find material here on integrability and the quantization of classical systems while mathematical subjects covered include among others Lie algebras and quantum groups

Quantization of Fields with Infinite-dimensional Invariance Groups. Iii. Generalized Schwinger-feynman Theory BRYCE S. DEWITT, NORTH CAROLINA UNIV CHAPEL HILL INST OF FIELD PHYSICS., 1962 Nonlinear field theories having elementary vertex functions of arbitrarily high order are presented Emphasis is given to purely formal aspects of the theory which may be expected to survive generalization to situations in which standard asymptotic conditions are inapplicable Since the context in which the field nonlinearities are assumed to appear is that of a non Abelian infinite dimensional invariance group detailed attention is given to the question of a group invariant measure for the Feynman functional integral It is shown that the physically important part of the measure is not determined by the group The theory of the propagators and correlation functions are also given which characterize the system when invariant variables are introduced The existence of a c number action functional which contains a complete description of all quantum processes is proved The second variational derivatives of this functional constitute the wave operator for the one particle propagators including all radiative corrections and its higher derivatives are the renormalized vertex functions Finally the implications for application to quantum gravodynamics are discussed Because it leads to nonlocal covariant equations for a complex metric tensor the way is open to transmutations of topology at the quantum level Author
