

## Minimal Brain Dysfunction in Children: Pre-, Peri-, Postnatal Factors and Developmental Characteristics

M. GOODMAN, PhD and C. GOODMAN, BA

### SUMMARY

*The importance of medical and developmental phenomena is emphasized in the diagnosis of minimal brain dysfunction in children. Yet there is little information about these areas compared with psychologically oriented criteria. A small sample of identified children subjected to a detailed and systematic survey showed little variation from normative expectations in terms of developmental milestones.*

*Although a typical presentation was not apparent, the survey shows that pre- and perinatal complications may be contributors to later learning problems. However, the authors advocate greater precision through a correlational approach as a prerequisite to further insight about the syndrome.*

**D**URING THE PAST TWO decades the clinical syndrome of minimal brain dysfunction as a causative factor in learning and behavior disorders of children has received considerable attention. Before 1920 related literature was limited and focused on brain damage sustained by adults. Specific aspects of the condition were described in segmented fashion during the following 30 years. 1-2 Strauss and Lehtinen<sup>3</sup>, whose work is still considered a classic in the area, provided a more comprehensive approach. However, in spite of extensive literature and research, confusion, variability and ambiguity exist. In the conclusion of a recent factor analytic study, Paine et al suggest: "Thus, minimal cerebral dysfunction is not a homogeneous diagnostic entity, but rather a way of describing a variety of unrelated minor dysfunctions, some

neurological, some behavioral and some cognitive, which may put a child in difficulties with his social and familial environment."<sup>4</sup>

Attempts have been made to provide clarity and consistency.

Stressing that a learning disability provides the core for homogeneity of the condition, and that manifestations are typically behavioral, rather than neurological, Johnson and Myklebust,<sup>5</sup> with orientational reference to Luria,<sup>6</sup> proposed the term "psychoneurological learning disability". The latter implies that behavior is affected by brain dysfunction, the problem consisting of processes alteration, rather than incapacity to learn. In order to distinguish the numerous handicaps found in children, included in the syndrome are adequate hearing and vision, average to high intelligence, and relatively adequate emotional adjustment. Consequently, the diagnostic process includes examination of sensation, perception, imagery, symbolization; inner, receptive, and expressive language, and conceptualization. Johnson and Myklebust stress "integrityes" that must be present for learning and categorize on the basis of peripheral and central nervous system functions. Readiness is a central concept in the scheme and, consequently, is highly interrelated with developmental characteristics.

The second example of an attempt toward clarification was co-sponsored by the National Society for Crippled Children and Adults, Inc. and the National Institute of Neurological Diseases and Blindness, Public Health Service, U.S.A. Published in 1966, *Minimal Brain Dysfunction in*
