**A Course in Reinforcement Learning** Dimitri Bertsekas, 2023-06-21 These lecture notes were prepared for use in the 2023 ASU research oriented course on Reinforcement Learning RL that I have offered in each of the last five years Their purpose is to give an overview of the RL methodology particularly as it relates to problems of optimal and suboptimal decision and control as well as discrete optimization There are two major methodological RL approaches approximation in value space where we approximate in some way the optimal value function and approximation in policy space whereby we construct a generally suboptimal policy by using optimization over a suitably restricted class of policies The lecture notes focus primarily on approximation in value space with limited coverage of approximation in policy space However they are structured so that they can be easily supplemented by an instructor who wishes to go into approximation in policy space in greater detail using any of a number of available sources including the author's 2019 RL book While in these notes we deemphasize mathematical proofs there is considerable related analysis which supports our conclusions and can be found in the author's recent RL and DP books These books also contain additional material on off line training of neural networks on the use of policy gradient methods for approximation in policy space and on aggregation

*Rollout, Policy Iteration, and Distributed Reinforcement Learning* Dimitri Bertsekas, 2021-08-20 The purpose of this book is to develop in greater depth some of the methods from the author's Reinforcement Learning and Optimal Control

recently published textbook Athena Scientific 2019 In particular we present new research relating to systems involving multiple agents partitioned architectures and distributed asynchronous computation We pay special attention to the contexts of dynamic programming policy iteration and control theory model predictive control We also discuss in some detail the application of the methodology to challenging discrete combinatorial optimization problems such as routing scheduling assignment and mixed integer programming including the use of neural network approximations within these contexts The book focuses on the fundamental idea of policy iteration i e start from some policy and successively generate one or more improved policies If just one improved policy is generated this is called rollout which based on broad and consistent computational experience appears to be one of the most versatile and reliable of all reinforcement learning methods In this book rollout algorithms are developed for both discrete deterministic and stochastic DP problems and the development of distributed implementations in both multiagent and multiprocessor settings aiming to take advantage of parallelism Approximate policy iteration is more ambitious than rollout but it is a strictly off line method and it is generally far more computationally intensive This motivates the use of parallel and distributed computation One of the purposes of the monograph is to discuss distributed possibly asynchronous methods that relate to rollout and policy iteration both in the context of an exact and an approximate implementation involving neural networks or other approximation architectures Much of the new research is inspired by the remarkable AlphaZero chess program where policy iteration value and policy networks approximate lookahead minimization and parallel computation all play an important role
