Adaptive Function and Brain Evolution Agustín González, Fernando Martínez-García, Luis Puelles, Hans J Ten Donkelaar, 2014-10-27 The brain of each animal shows specific traits that reflect its phylogenetic history and its particular lifestyle Therefore comparing brains is not just a mere intellectual exercise but it helps understanding how the brain allows adaptive behavioural strategies to face an ever changing world and how this complex organ has evolved during phylogeny giving rise to complex mental processes in humans and other animals These questions

attracted scientists since the times of Santiago Ramon y Cajal one of the founders of comparative neurobiology In the last decade this discipline has undergone a true revolution due to the analysis of expression patterns of morphogenetic genes in embryos of different animals The papers of this e book are good examples of modern comparative neurobiology which mainly focuses on the following four Grand Questions a How are different brains built during ontogeny b What is the anatomical organization of mature brains and how can they be compared c How do brains work to accomplish their function of ensuring survival and ultimately reproductive success d How have brains evolved during phylogeny The title of this e book Adaptive Function and Brain Evolution stresses the importance of comparative studies to understand brain function and the reverse of considering brain function to properly understand brain evolution These issues should be taken into account when using animals in the research of mental function and dysfunction and are fundamental to understand the origins of the human mind

Neural Plasticity Across the Lifespan Gianfranco Denes,2015-12-14 Neural Plasticity Across the Lifespan reviews the recent scientific developments which are transforming our understanding of the human brain For many years it was thought that modifications to the structural and functional organization of the brain were limited to a short early period of life the critical period and in adults to the memory system Recent research suggests that on the contrary we should see the human brain as a flexible structure which adapts and modifies in response to learning sensory experience age and disease The book provides an integrated overview of contemporary research on neural plasticity the process by which the brain can change in structure and function to cope with new experiences and react to the effects of acquired damage or sensory deprivation It reviews data on plasticity in the developing brain looking at both typical and atypical development alongside clinical and observational research on the adult population It covers a number of key topics including different forms of neural plasticity factors affecting neural plasticity ageing and gender neural plasticity in language acquisition memory and bodily self consciousness mechanisms of repair plasticity following sensory deprivation and acquired brain damage This is an accessible overview of an emerging field of research which has fundamental implications for how we perceive our potential to change throughout our lives It will be essential reading for all students of cognitive development cognitive neuroscience and lifespan development
