Milone, C. Sterken, 2011-04-06 This book will bring together experts in the field of astronomical photometry to discuss how their subfields provide the precision and accuracy in astronomical energy flux measurements that are needed to permit tests of astrophysical theories Differential photometers and photometry improvements in infrared precision the improvements in precision and accuracy of CCD photometry the absolute calibration of flux the development of the Johnson UBVRi photometric system and other passband systems to measure and precisely classify specific types of stars and astrophysical quantities and the current capabilities of spectrophotometry and polarimetry to provide precise and accurate data will all be discussed in this volume The discussion of differential or two star photometers will include those developed for planetary as well as stellar photometry and will range from the Princeton polarizing photometer through the pioneering work of Walraven to the differential photometers designed to measure the ashen light of Venus and to counter the effects of aurorae at high latitude sites the last to be discussed will be the Rapid Alternate Detection System RADS developed at the University of Calgary in the 1980s **NASA Technical Translation**, 1969 *Journal of Research of the National Bureau of Standards* United States. Molecular Structure Gerhard Herzberg, Klaus-Peter Huber, John William Tranter Spinks, 1979-12-31 Since the publication in 1950 of Vol I Spectra of Diatomic Molecules of Molecular Spectra and Molecular Structure much progress has been made in the field While there have been some important refinements in the theory of diatomic molecular spectra most of the advances have been in the further exploration of individual spectra Not only has the number of molecules about which some spectroscopic data are available been increased by a factor of 2 to 3 but also the spectroscopic information about the molecules known in 1950 has been vastly extended This is due to the observation of new electronic states about three times as many as known before the enormous improvements in the accuracy of the constants of the states known in 1950 and the determination of higher order constants In view of the increasing use of spectroscopic information on diatomic molecules in other fields of physics in chemistry and in astrophysics it appeared desirable to prepare an up to date version of the table of molecular constants in the appendix of Vol I This updating proved to be far more time consuming than originally anticipated and it is only now 10 years that we are able to present such a table which instead after its initiation of the original 80 pages plus 30 pages of bibliography now fills a volume of 700 pages In the interest of economy and unlike the original version the new table has been produced by photo offset from the final manuscript
