Rheumatoid arthritis (chronic polyarthritis)

Rheumatoid arthritis is a chronic inflammatory disease that affects the joints. It is characterized by the formation of rheumatoid nodules, which are small, firm lumps of tissue that develop under the skin. The disease is most common in the hands and wrists, but it can also affect other joints, such as the knees, hips, and ankles. The inflammation causes the joints to become swollen, painful, and stiff, especially in the morning. Over time, the disease can lead to joint damage and deformity.

Ankylosing spondylitis

Ankylosing spondylitis is a chronic inflammatory disease that affects the spine and neck. It is characterized by the formation of bony bridges between the vertebrae, which can lead to a rigid spine. The disease is most common in the lower back, but it can also affect the neck and chest. The inflammation causes the joints to become swollen, painful, and stiff, especially in the morning. Over time, the disease can lead to joint damage and deformity.

Typical posture after many years of suffering from ankylosing spondylitis. The mobility of the spine is seriously impaired or even completely abolished.

Self-healing rheumatic diseases

Self-healing rheumatic diseases are a group of conditions that affect the joints and are characterized by their ability to resolve themselves over time. These conditions include acute rheumatic fever, streptococcal toxic shock syndrome, and erythema nodosum. The inflammation is typically caused by a bacterial infection, and the disease resolves itself as the body's immune system fights off the infection.

It is characterized by the formation of synovial nodules, which are small, firm lumps of tissue that develop under the skin. The disease is most common in the hands and wrists, but it can also affect other joints, such as the knees, hips, and ankles. It is characterized by the formation of subacute nodules, which are small, firm lumps of tissue that develop under the skin.
