Robotics Today, 1982 **Industrial Robot Handbook** Richard K. Miller, 2013-11-21. These are exciting times for manufacturing engineers. It has been said that American industry will undergo greater changes during the 1980 and 1990 decades than it did during the entire eight preceding decades of this century. The industrial robot has become the symbol of this progress in computer-integrated manufacturing. This book is for engineers and managers in manufacturing industries who are involved in implementing robotics in their operations. With tens of thousands of industrial robots already in use in the United States, there are plenty of role models for proposed applications to be patterned after. This book provides an overview of robot applications and presents case histories that might suggest applications to engineers and managers for implementation in their own facilities. The application of industrial robots were well developed in the late 1970s and early 1980s. While the reader may note some of the examples discussed in this handbook incorporate older robot models, it is the application that is of interest. As Joseph Engelberger, the founding father of robotics, has pointed out, industrial robots in 1988 are doing pretty much the same kind of work as they did in 1980.

Collection Development in Sci-tech Libraries Ellis Mount, 1984 **Robot Reliability and Safety** B.S. Dhillon, 2012-12-06. Robots are increasingly being used in industry to perform various types of tasks. Some of the tasks performed by robots in industry are spot welding, materials handling, arc welding, and routing. The population of robots is growing at a significant rate in various parts of the world. For example, in 1984, a report published by the British Robot Association indicated a robot population distribution between Japan 64,600, Western Europe 20,500, and the United States 13,000. This shows a significant number of robots in use. Data available for West Germany and the United Kingdom indicate that in 1977 there were 541 and 80 robots in use, respectively, and in 1984 these numbers went up to 6600 and 2623, respectively. Just as for other engineering products, the reliability and safety of

robots are important A robot has to be safe and reliable An unreliable robot may become the cause of unsafe conditions high maintenance costs inconvenience etc Robots make use of electrical mechanical pneumatic electronic and hydraulic parts This makes their reliability problem a challenging task because of the many different sources of failures According to some published literature the best mean time between failures MTBF achieved by robots is only 2500 hours This means there is definite room for further improvement in robot reliability With respect to safety there have been five fatal accidents involving robots since 1978
