

Design of Nonlinear Automatic Flight Control Systems*

WILLIAM L. GARRARD† and JOHN M. JORDAN‡

A nonlinear aircraft automatic flight control system, developed for use at high angles of attack, reduces altitude loss during stall and increases the magnitude of the angle of attack from which the aircraft can recover from stall.

Key Words: *Autopilot control; attitude control; closed loop systems; control systems; nonlinear control systems; perturbations; stability.*

Summary—A method for the design of nonlinear automatic flight control systems is developed, and the performance of a control system synthesized by use of this method is compared to the performance of control systems designed by use of linear quadratic optimal control theory. Comparisons are made on the basis of aircraft dynamic response at high angles of attack. It is found that the nonlinear design for reduced altitude loss during stall and recovery from the attack state of the angle of attack for which the aircraft can recover from stall.

1. INTRODUCTION

Modern high-performance aircraft often operate in flight regimes where nonlinearities significantly affect dynamic response. For example, fighter aircraft may operate at high angles of attack where the lift coefficient cannot be accurately represented as a linear function of angle of attack or at high roll rates where nonlinear inertia cross-coupling may result in instabilities. In such situations, dynamic response may be improved if controller design is based on nonlinear rather than linear models of aircraft dynamics.

A number of investigators have studied the problem of using optimal control theory as the basis for the design of suboptimal, feedback controllers for nonlinear systems and a systematic procedure has been developed for systems in which the nonlinearities can be expressed as a power series in the state vector[1-9]. This procedure has been applied to only a few problems of practical interest and results previously reported[10, 11] do not indicate that nonlinear control produces clear-cut improvements in dynamic response when compared with controllers designed using linear quadratic optimal control theory.

The objective of this paper is to apply nonlinear feedback control theory to the design of a flight control system which can provide acceptable dynamic response over the entire range of angle of

attack which a modern high performance aircraft may operate. Control system performance is particularly critical at large angles of attack as the uncompensated dynamic characteristics of the aircraft may result in abnormal and sometimes hazardous flying qualities.

The paper is divided into three major sections. In the first section, the nonlinear equations describing the longitudinal motion of an aircraft are developed. The general equations are derived and are applied to a specific aircraft, the F-8 Crusader. Synthesis of the linear and nonlinear controllers is presented in the second section. The most known nonlinear case is given the majority of attention. Evaluation of the linear and nonlinear control systems are presented in the third section. It is found that the nonlinear system results in considerably improved dynamic response when compared with the linear system.

2. NONLINEAR DYNAMICAL MODEL

The forces considered and the coordinate system used are shown in Fig. 1. The drag is small compared with the lift and weight and is neglected in this analysis. The lift is separated into its wing and tail components[12].

The basic equations of longitudinal motion are

$$m\ddot{x} = -m\dot{y}^2 - \exp(\alpha\beta) \{ L_w \cos \alpha + L_t \sin \alpha \} \quad (1)$$

$$m\dot{y} = m\dot{x} - \exp(\alpha\beta) \{ L_w \sin \alpha - L_t \cos \alpha \} \quad (2)$$

$$I_y \ddot{\beta} = M_w \cos \alpha - \xi L_t \cos \alpha \quad (3)$$

where

$m =$ mass of aircraft

$x =$ velocity of aircraft in X direction

$y =$ velocity of aircraft in Z direction

$\beta =$ angular displacement about Y axis, measured clockwise from the horizon as shown in Fig. 1

$I_y =$ moment of inertia of aircraft about Y axis

$M_w =$ wing lift

$L_t =$ tail lift

$\alpha =$ wing angle of attack

$\alpha_t =$ tail angle of attack

$M_w =$ wing moment
