

Nonlinear Structural Equation Models: The Kenny–Judd Model With Interaction Effects

Karl G. Jöreskog
Fan Yang
Uppsala University, Sweden

Kenny and Judd (1984) formulated a model with interaction effects of two latent variables and suggested using product variables to estimate the model. This model and the implications of using products of latent and observed variables is investigated.

In this chapter, we use the Kenny–Judd model as an example of a general model with nonlinear relationships between latent variables. Most of the arguments presented apply more generally than just to the Kenny–Judd model.

The Kenny–Judd model is formulated in the next section. In the third section, it is shown that the model cannot be estimated without the use of products of observed variables. Kenny and Judd suggested using four product variables, but, in fact, only one product variable is necessary for identification, so this case is considered first. The case of four product variables is considered later.

The implications of using product variables are non-normality and constraints on the mean vector as well as on the covariance matrix. A number of alternative ways of estimating the model are discussed and evaluated.

THE KENNY–JUDD MODEL

Kenny and Judd (1984) formulated a nonlinear regression equation:

$$y = \alpha + \gamma_1 \xi_1 + \gamma_2 \xi_2 + \gamma_3 \xi_1 \xi_2 + \zeta, \quad (1)$$

with the idea that there is an interactive effect of ξ_1 and ξ_2 on y , in addition to the direct effects of ξ_1 and ξ_2 alone, and this interactive effect is manifesting itself in terms of an effect of the product of ξ_1 and ξ_2 .
