Opportunities and Challenges for Wild Bee Conservation Kris Braman, Michael D. Ulyshen, 2025-01-06 Conserving pollinators in anthropogenic habitats of all descriptions is critically important. Often we consider single system dynamics yet pollinators move readily between land uses so diverse pollinator communities in urban forest or orchard settings e.g. have the potential to benefit neighboring habitats including crops. Pollination services provided by insects and other animals are critical to the reproductive success of many plants in a diversity of environments. Conserving and maintaining a diverse assemblage of wild bees is essential for healthy and functioning ecosystems. In addition, improving conditions for pollinators in urban areas is likely to improve the quality of life for human inhabitants and will provide opportunities for children to develop a sense of connection with nature. Understanding the biology and ecology of wild bees in diverse settings is the foundation of conservation. Therefore, understanding the biology and ecology of wild bees and the factors influencing their abundance and diversity across multiple systems to inform conservation efforts is the goal. Recent advances find that forests and forest remnants are critically important to global pollinator diversity and can enhance pollinator diversity in adjacent areas including crops. This research topic will address the opportunities and challenges for wild bee conservation across diverse land use types.

The pollination services of forests Krishnan, S., Wiederkehr Guerra, G., Bertrand, D., Wertz-Kanounnikoff, S. and Kettle, C.J., 2020-06-01 Most flowering plants including wild species and many food crops are pollinated by animals and are vital therefore for biological production and the maintenance of biodiversity. Pollinators benefit from diverse natural habitats for forage and nesting especially when these are limited in plant production systems. Landscape and forest management practices can help ensure the continued availability of pollinators and thereby increase resilience and the productivity of forestry and agriculture. The extent of forests and other natural habitats in a landscape plays a role in determining the species composition of pollinators. Agricultural landscapes adjoining fragmented forests and natural areas benefit from pollinator services and animal pollinated crops therefore achieve higher fruit set. Forest management practices can have significant effects on pollinator abundance and diversity. They affect forest variables such as structure, species composition, soil dynamics, hydrology and light availability all of which can affect pollinator species composition and diversity and plant-pollinator networks. Indigenous and local knowledge can contribute to the conservation of pollinators through traditional management practices. This working paper which is aimed at forest practitioners, landscape planners and land use decision makers reviews published literature on the impacts of forest and landscape management practices on pollinators. It also addresses the implications of climate change, collates 36 case studies and makes recommendation on measures for maintaining pollinator diversity and abundance in forests and landscapes.
