Sensorimotor Control Of Movement And Posture:

Sensorimotor Control of Movement and Posture Simon C. Gandevia, Uwe Proske, Douglas G. Stuart, 2012-12-06 This collection of contributions on the subject of the neural mechanisms of sensorimotor control resulted from a conference held in Cairns Australia September 3-6 2001 While the three of us were attending the International Union of Physiological Sciences IUPS Congress in St Petersburg Russia in 1997 we discussed the implications of the next Congress being awarded to New Zealand We agreed to organise a satellite to this congress in an area of mutual interest the neuroscience of movement and sensation Australia has a long standing and enviable reputation in the field of neural mechanisms of sensorimotor control Arguably this reached its peak with the award of a Nobel Prize to Sir John Eccles in 1963 for his work on synaptic transmission in the central nervous system Since that time the subject of neuroscience has progressed considerably One advance is the exploitation of knowledge acquired from animal experiments to studies on conscious human subjects In this development Australians have achieved international prominence particularly in the areas of kinaesthesia and movement control This bias is evident in the choice of subject matter for the conference and subsequently this book It was also decided to assign a whole section to muscle mechanics a subject that is often left out altogether from conferences on motor control Cairns is a lovely city and September is a good time to visit it

Neural and Computational Modeling of Movement Control Ning Lan, Vincent C. K. Cheung, Simon C. Gandevia, 2017-04-17 In the study of sensorimotor systems an important research goal has been to understand the way neural networks in the spinal cord and brain interact to control voluntary movement Computational modeling has provided insight into the interaction between centrally generated commands proprioceptive feedback signals and the biomechanical responses of the moving body Research in this field is also driven by the need to improve and optimize rehabilitation after nervous system injury and to devise biomimetic methods of control in robotic devices This research topic is focused on efforts dedicated to identify and model the neuromechanical control of movement Neural networks in the brain and spinal cord are known to generate patterned activity that mediates coordinated activation of multiple muscles in both rhythmic and discrete movements e.g. locomotion and reaching Commands descending from the higher centres in the CNS modulate the activity of spinal networks which control movement on the basis of sensory feedback of various types including that from proprioceptive afferents The computational models will continue to shed light on the central strategies and mechanisms of sensorimotor control and learning This research topic demonstrated that computational modeling is playing a more and more prominent role in the studies of postural and movement control With increasing ability to gather data from all levels of the neuromechanical sensorimotor systems there is a compelling need for novel creative modeling of new and existing data sets because the more systematic means to extract knowledge and insights about neural computations of sensorimotor systems from these data is through computational modeling While models should be based on experimental data and validated with experimental evidence they should also be flexible to

provide a conceptual framework for unifying diverse data sets to generate new insights of neural mechanisms to integrate new data sets into the general framework to validate or refute hypotheses and to suggest new testable hypotheses for future experimental investigation It is thus expected that neural and computational modeling of the sensorimotor system should create new opportunities for experimentalists and modelers to collaborate in a joint endeavor to advance our understanding of the neural mechanisms for postural and movement control The editors would like to thank Professor Arthur Prochazka who helped initially to set up this research topic and all authors who contributed their articles to this research topic Our appreciation also goes to the reviewers who volunteered their time and effort to help achieve the goal of this research topic We would also like to thank the staff members of editorial office of Frontiers in Computational Neuroscience for their expertise in the process of manuscript handling publishing and in bringing this ebook to the readers The support from the Editor in Chief Dr Misha Tsodyks and Dr Si Wu is crucial for this research topic to come to a successful conclusion We are indebted to Dr Si Li and Ms Ting Xu whose assistant is important for this ebook to become a reality Finally this work is supported in part by grants to Dr Ning Lan from the Ministry of Science and Technology of China 2011CB013304 the Natural Science Foundation of China No 81271684 No 61361160415 No 81630050 and the Interdisciplinary Research Grant cross Engineering and Medicine by Shanghai Jiao Tong University YG20148D09 Dr Vincent Cheung is supported by startup funds from the Faculty of Medicine of The Chinese University of Hong Kong Guest Associate Editors Ning Lan Vincent Cheung and Simon Gandevia

Grieve's Modern Musculoskeletal Physiotherapy Gwendolen Jull, Ann Moore, Deborah Falla, Jeremy Lewis, Christopher McCarthy, Michele Sterling, 2015-05-11 Since the third edition of Grieve's Modern Manual Therapy was published in 2005 the original concepts of manipulative therapy have grown to embrace new research generated knowledge Expansions in practice have adopted new evidence which include consideration of psychological or social moderators The original manual therapy or manipulative therapy approaches have transformed into musculoskeletal physiotherapy and this is recognized by the change in title for the new edition *Grieve's Modern Musculoskeletal Physiotherapy* *Grieve's Modern Musculoskeletal Physiotherapy* continues to bring together the latest state of the art research from both clinical practice and the related basic sciences which is most relevant to practitioners The topics addressed and the contributing authors reflect the best and most clinically relevant contemporary work within the field of musculoskeletal physiotherapy With this as its foundation and a new six strong editorial team at its helm the fourth edition now expands its focus from the vertebral column to the entire musculoskeletal system For the first time both the spine and extremities are covered capturing the key advances in science and practices relevant to musculoskeletal physiotherapy The book is divided into five parts containing multiple sections and chapters The first part looks at advances in the sciences underpinning musculoskeletal physiotherapy practice Here there is commentary on topics such as movement the interaction between pain and motor control as well as neuromuscular adaptations to exercise Applied anatomical structure is covered in addition to the challenges of lifestyle and

ageing A new section highlights the important area of measurement and presents the scope of current and emerging measurements for investigating central and peripheral aspects relating to pain function and morphological change Another section discusses some contemporary research approaches such as quantitative and qualitative methods as well as translational research Part III contains sections on the principles of and broader aspects of management which are applicable to musculoskeletal disorders of both the spine and periphery Topics include models for management prescription communication and pain management and contemporary principles of management for the articular nervous and sensorimotor systems In recognition of the patient centred and inclusive nature of contemporary musculoskeletal practice there is also discussion about how physiotherapists may use cognitive behavioural therapies when treating people with chronic musculoskeletal disorders The final part of the book focuses on selected contemporary issues in clinical practice for a particular region condition or the most topical approaches to the diagnosis and management of a region A critical review of the evidence or developing evidence for approaches is given and areas for future work are highlighted Presents state of the art manual therapy research from the last 10 years Multidisciplinary authorship presents the viewpoints of different professions crucial to the ongoing back pain management debate Highly illustrated and fully referenced

Biomechanics and Motor Control Mark L. Latash, Vladimir Zatsiorsky, 2015-10-06 Biomechanics and Motor Control Defining Central Concepts provides a thorough update to the rapidly evolving fields of biomechanics of human motion and motor control with research published in biology psychology physics medicine physical therapy robotics and engineering consistently breaking new ground This book clarifies the meaning of the most frequently used terms and consists of four parts with part one covering biomechanical concepts including joint torques stiffness and stiffness like measures viscosity damping and impedance and mechanical work and energy Other sections deal with neurophysiological concepts used in motor control such as muscle tone reflex pre programmed reactions efferent copy and central pattern generator and central motor control concepts including redundancy and abundance synergy equilibrium point hypothesis and motor program and posture and prehension from the field of motor behavior The book is organized to cover smaller concepts within the context of larger concepts For example internal models are covered in the chapter on motor programs Major concepts are not only defined but given context as to how research came to use the term in this manner Presents a unified approach to an interdisciplinary fragmented area Defines key terms for understanding Identifies key theories concepts and applications across theoretical perspectives Provides historical context for definitions and theory evolution

Differential Learning in Physiotherapy Wolfgang I. Schöllhorn, Agnė Slapšinskaitė-Dackevičienė, 2025-11-07 This book explores a new scientifically positively tested motor learning approach for physiotherapists providing practical examples for applications It emphasizes that learning from differences is more effective than repetitive learning offering a novel perspective on educational methods This approach enhances the effectiveness of teaching and learning in physiotherapy The book explores the application of neurophysiological

and system dynamic thinking underpinned with information on theoretical aspects to overcome master theories based on opinion papers This fresh approach will lead to innovative insights and solutions within the rehabilitation field Each chapter draws on scientifically sound principles and includes references to reviewed and published studies A close link between theoretical concepts and their practical consequences is presented This bridge between theory and application ensures that readers can readily apply what they learn in real world physiotherapy settings Besides a learning approach based on the individuality of patients is explored emphasizing a model for therapist patient interaction This patient oriented method contrasts with one sided therapist or model oriented approaches and can result in more personalized and effective patient care that is highly demanded in the XXI century rehabilitation context From acute injuries to chronic disorders this book equips physiotherapists and other rehabilitation specialists all over the world with the tools they need to customize treatment plans to meet the unique needs of each patient enhancing the quality of care delivered Applying the Differential Learning approach it illustrates how methods can be finely tailored to diverse circumstances [Research Awards Index](#) ,1988
