Chromatographic and Membrane Processes in Biotechnology C.A. Costa, Joaquim S. Cabral, 2012-12-06
Separation processes in biotechnology are of increasing industrial importance since they entail the major costs of bioprocessing especially when high purity is required Chromatography and membranes are two of the most important technologies used for direct treatment of fermentation broths as well as for high resolution steps in product purification The theoretical foundations of chromatographic and membrane processes are well understood for the case of small molecules Nevertheless there is a need to adapt and further develop that knowledge to the processing of large biological molecules This is being achieved with the contribution of other areas like molecular biology and materials science The objective of this

NATO Advanced Study Institute is to present an updated treatment of the fundamentals of chromatographic and membrane processes with special relevance in bioprocessing This volume collects the lectures presented at this Institute The lectures are arranged in five chapters Chapter 1 deals with chromatographic processes covering topics like equilibrium kinetics and contacting devices Membrane processes and some applications in biotechnology are treated in chapter 2 Chapter 3 is devoted to affinity chromatographic and membrane processes Chapter 4 considers the current developments on chromatographic supports and membranes both from the constitutive materials and form points of view Scale up optimization and reaction separation integration are the topics covered in chapter 5 We are very grateful to all lecturers and participants that made possible this Institute Financial support from NATO Scientific Affairs Division INIC JNICT FLAD University of Ac ores and DRT Ac ores is gratefully acknowledged

Separations for Biotechnology 2 D. Leo Pyle, 2012-12-06 The challenge of bioseparations is to isolate and purify identified products from the dilute product broth produced from cell culture Innovation in bioseparations technology is increasingly driven by the requirements imposed by the growing importance of production on a process scale of injectable grade products and economic pressures to improve the efficiency of downstream processing As in other areas of technical change science does not necessarily precede new technology progress results from a complex and messy mixture of advances in understanding ingenious ideas novel techniques and chance discoveries What is certain is that close interaction between academics and practitioners biological scientists and process engineers is needed to solve the problems of bioseparations The Second International Conference on Separations for Biotechnology at Reading UK in September 1990 set out to provide a critical multidisciplinary forum for the discussion of bioseparations This volume contains the papers presented at the meeting The meeting was organised around six themes with oral and poster presentations on the science and practice of bioseparations technology and the same structure has been kept for this book We have also included the texts of the keynote review paper by Professor Alan Michaels and the introductory review papers specially commissioned for the conference Within each part of this book the review paper is followed by the contributed papers grouped alphabetically by their first author All the original papers published here were accepted for publication after scientific refereeing

Engineering Processes for Bioseparations LAURENCE R. WEATHERLEY, 2013-10-22 The use of biotechnology in chemical synthesis offers up numerous advantages to the engineer in the process industries but it also presents a number of fundamental challenges and difficulties which impinge directly on separation process requirements The use of biochemical separations has grown significantly during the past decade and is especially used in process industries such as healthcare and food processing However it is becoming increasingly more important in areas such as recycling and waste water treatment and as industry shifts towards cleaner processes biochemical separations will continue to grow The two main objectives of this book are to focus on the application of existing separation process techniques to the recovery and purification of biologically derived products and to examine the state of knowledge of

new techniques which have future potential Within these objectives the complexities and breadth of problems associated with biological separations are discussed specific engineering techniques are featured and their adaptation to biochemical separations are highlighted

Basic Separation Techniques in Biochemistry R O Okotore,1998 Basic Separation Techniques In Biochemistry Provides Information On The Basic Separation Techniques Most Commonly Employed In Biochemical Research The Basic Principles And Applications Of The Routine Methods For The Fractionation Of Subcellular Macromolecules Have Been Discussed In Simple And Comprehensive Manner The Methodology Of Each Technique Is Presented In A Precise And Concise Way For Meaningful Understanding To A Beginner Student The Book Is In Eight Chapters Each With Statement Of Objectives The Book Will Prove Of Value To Undergraduate Students Of Biochemistry Chemistry And Biology As Supplementary Reading Text To More Advanced Texts In Laboratory Techniques
