Segmental Motor System:

The Segmental Motor System Marc D. Binder, Lorne M. Mendell, 1990 This volume presents a broad range of knowledge about the organization of the segmental motor apparatus of mammals Over the past 30 years the mammalian segmental motor system has served as a template for research on neural trophism synaptic function and connectivity neuronal recognition and neuronal modeling and has provided the definitive neural aggregation the motoneuron pool In addition a number of important experimental and analytical techniques including intracellular recording signal averaging linear systems analysis conditioning testing spatial facilitation and occlusion and excitability testing have emerged from this body of research to become important components of the experimental armamentarium of biologists working throughout the nervous system The book acknowledges the seminal contributions of Professor Elwood Henneman to this field and to neuroscience in general and provides a systematic discussion of some of the fundamental contemporary issues in motor control It addresses such questions as the intrinsic properties of motoneurons and muscle fibers the phenomenon of orderly motor unit recruitment and its underlying mechanisms the neural mechanical correlations between motoneurons and the muscle units the innervation and the analysis of synaptic inputs to motoneuron pools In focusing on these issues the volume not only provides comprehensive coverage of the functional organization of the motoneuron pool and its target skeletal muscle but also illuminates the extensive ramifications that research in this area has had on neurobiology

The Head-neck Sensory Motor System A. Berthoz, Werner Graf, Pierre Paul Vidal, 1992 The head carries most of the sensory systems that enable us to function effectively in our three dimensional habitat Without adequate head movement control efficient spatial orientation and motor responses to visual and auditory stimuli could not be carried out This is the most comprehensive and up to date account of the control of vertebrate head movements and its biomechanical and neural basis It covers the entire spectrum of research on head neck movements ranging from the global description and analysis of a particular behavior to its underlying mechanisms at the level of neurotransmitter release and membrane biophysics Physiological and anatomical aspects are stressed The role of head movements in upright stance and other functional contexts within the vertebrate hierarchy is juxtaposed with the mechanisms of orienting behavior in a number of invertebrates This reveals a plethora of solutions among different animal species for the problem of orientation in three dimensional space Although head movement control in humans figures prominently in this volume the anatomical physiological comparisons show that the human system is not unique The conference from which this volume originated surveyed current research and theory on motor control mechanisms in the head neck sensory motor system It was held in Fontainebleau France on July 17-24 1989 The book provides a broad panorama of methodological and theoretical approaches to the field of head movement control
