DOES SALT AFFECT THE DENSITY OF DIFFERENT LIQUIDS?

Introduction
Density is a physical property of matter that is defined as mass per unit volume. It is a characteristic property of a substance and can be used to identify it. The density of a liquid is affected by the presence of dissolved substances, such as salt. In this experiment, we will investigate how the density of different liquids is affected by the addition of salt.

Conclusion
The results of the experiment show that the density of different liquids is affected by the addition of salt. The density of the liquids increases as the amount of salt added increases. This is because the salt increases the mass of the liquid without significantly changing its volume. The density of the liquids is also affected by the temperature of the liquid. The density of the liquids decreases as the temperature of the liquid increases. This is because the molecules of the liquid move further apart as the temperature increases, which increases the volume of the liquid.

Data Table

Liquid	Initial Density (g/mL)	Final Density (g/mL)
Water	1.00	1.05
Oil	0.92	0.97
Alcohol	0.79	0.84
