also provide higher availability This dissertation details the design of three serverless subsystems each of which distributes a specific piece of functionality that a traditional system would implement as part of a central server I describe and evaluate cooperative caching a way to coordinate client caches to replace the central server s cache I evaluate different distributed disk storage architectures and present several improvements on previous log structured redundant storage systems Finally I present the design of a distributed management architecture that splits the control of the file system among managers while maintaining a seamless single system image Together these pieces form a a sic serverless file system that eliminates central bottlenecks I describe the integration of these components in the context of xFS a prototype serverless file system implementaton Initial performance measurements illustrate the promise of the serverless approach for providing scalable file systems **Computer Graphics for Architects, Engineers, and Environmental Designers** D.
