Mobile Multimedia Communications David J. Goodman,Dipankar Raychaudhuri,2013-11-11 In 1997 the two hottest topics in information technology are the Internet and mobile communications Each one has the enthusiastic attention of the consuming public investors and the technical community In a time of rapid expansion they both face technical obstacles to meeting the public s high expectations This situation stimulates a high volume of research in both areas To bring the Internet into the twenty first century the research community focuses on multimedia communications in which integrated systems store transport and process many types of information simultaneously A major challenge is to meet the of each information service This problem is separate performance requirements especially challenging when a system has to deliver

broadband real time services such as full motion video Meanwhile the mobile communications research community continues its long term struggle against the triple challenge of mobility ether and energy Mobility refers to the changing locations of terminals When terminals are mobile networks have to determine their locations and dynamically establish routes for information The networks also have to rearrange themselves in order to maintain links to terminals with active communications sessions Ether refers to the problems of wireless communications including limited bandwidth rapidly changing radio propagation conditions mutual interference of radio signals and vulnerability of systems to eavesdropping and unauthorized access Energy refers to the fact that portable information devices carry their own power sources The rate at which the batteries of cellular telephones and portable computers drain their energy has a strong effect on their utility

Multimedia Systems Ralf Steinmetz, Klara Nahrstedt, 2013-03-09 Multimedia Systems discusses the basic characteristics of multimedia operating systems networking and communication and multimedia middleware systems The overall goal of the book is to provide a broad understanding of multimedia systems and applications in an integrated manner a multimedia application and its user interface must be developed in an integrated fashion with underlying multimedia middleware operating systems networks security and multimedia devices Fundamental characteristics of multimedia operating and distributed communication systems are presented especially scheduling algorithms and other OS supporting approaches for multimedia applications with soft real time deadlines multimedia file systems and servers with their decision algorithms for data placement scheduling and buffer management multimedia communication transport and streaming protocols services with their error control congestion control and other Quality ofService aware and adaptive algorithms synchronization services with their skew control methods and group communication with their group coordinating algorithms and other distributed services 5G Multimedia Communication Zoran S.
