Multivariate Statistical Modeling And Data Analysis:

Multivariate Statistical Modeling and Data Analysis H. Bozdogan, Arjun K. Gupta, 2012-12-06 This volume contains the Proceedings of the Advanced Symposium on Multivariate Modeling and Data Analysis held at the 64th Annual Meeting of the Virginia Academy of Sciences VAS American Statistical Association's Virginia Chapter at James Madison University in Harrisonburg Virginia during May 15-16 1986 This symposium was sponsored by financial support from the Center for Advanced Studies at the University of Virginia to promote new and modern information theoretic statistical modeling procedures and to blend these new techniques within the classical theory Multivariate statistical analysis has come a long way and currently it is in an evolutionary stage in the era of high speed computation and computer technology The Advanced Symposium was the first to address the new innovative approaches in multivariate analysis to develop modern analytical and yet practical procedures to meet the needs of researchers and the societal need of statistics vii-viii PREFACE Papers presented at the Symposium by eminent researchers in the field were geared not just for specialists in statistics but an attempt has been made to achieve a well balanced and uniform coverage of different areas in multivariate modeling and data analysis The areas covered included topics in the analysis of repeated measurements cluster analysis discriminant analysis canonical correlations distribution theory and testing bivariate density estimation factor analysis principle component analysis multidimensional scaling multivariate linear models nonparametric regression etc

Multivariate Statistical Modelling Based on Generalized Linear Models Ludwig Fahrmeir, Gerhard Tutz, 2013-11-11 Classical statistical models for regression time series and longitudinal data provide well established tools for approximately normally distributed variables Enhanced by the availability of software packages these models dominated the field of applications for a long time With the introduction of generalized linear models GLM a much more flexible instrument for statistical modelling has been created The broad class of GLMs includes some of the classical linear models as special cases but is particularly suited for categorical discrete or nonnegative responses The last decade has seen various extensions of GLMs multivariate and multicategorical models have been considered longitudinal data analysis has been developed in this setting random effects and nonparametric predictors have been included These extended methods have grown around generalized linear models but often are no longer GLMs in the original sense The aim of this book is to bring together and review a large part of these recent advances in statistical modelling Although the continuous case is sketched sometimes throughout the book the focus is on categorical data The book deals with regression analysis in a wider sense including not only cross sectional analysis but also time series and longitudinal data situations We do not consider problems of symmetrical nature like the investigation of the association structure in a given set of variables For example log linear models for contingency tables which can be treated as special cases of GLMs are totally omitted The estimation approach that is primarily considered in this book is likelihood based
