Diaphragm Bracing of Steel Bridge Girders W. M. Kim Roddis, 2008 Steel plate girder bridges make use of traditional cross frame diaphragms to stabilize the compression flange of girders These braces are required during construction especially during deck placement to prevent lateral torsional buckling of bridge girders Girder buckling capacity is a function of cross frame diaphragm spacing as well as strength and stiffness Recent developments in bridge design may cause the governing girder limit state to shift from one of strength to one of stability These developments include the elimination of in plan bracing composite girders High Performance Steels and phased deck replacements In addition the American Association of State Highway and Transportation Officials AASHTO has changed its code requirement for cross frame diaphragm spacing in the 1998 AASHTO LRFD Bridge Design Specifications The requirement for 25 foot maximum brace spacing has been removed The current requirement is for a rational analysis to determine cross frame diaphragm spacing Explanations of the problems these changes cause in design are discussed A case study is presented of a bridge that suffered construction difficulties during deck placement This investigation found that the cross frame diaphragms were not stiff enough to brace the plate girders during the deck placement Suggestions are given as to an efficient economical design and spacing for cross frame diaphragms on plate girder bridges Behaviour of Steel Structures in Seismic Areas Federico Mazzolani, Ricardo

Gallagher, Ronald D. Ziemian, 2015 Note This purchase option should only be used by those who want a print version of this textbook An e version PDF is available at no cost at www.mastan2.com DESCRIPTION The aims of the first edition of Matrix Structural Analysis were to place proper emphasis on the methods of matrix structural analysis used in practice and to lay the groundwork for more advanced subject matter This extensively revised Second Edition accounts for changes in practice that have taken place in the intervening twenty years It incorporates advances in the science and art of analysis that are suitable for application now and will be of increasing importance in the years ahead It is written to meet the needs of both the present and the coming generation of structural engineers KEY FEATURES Comprehensive coverage As in the first edition the book treats both elementary concepts and relatively advanced material Nonlinear frame analysis An introduction to nonlinear analysis is presented in four chapters a general introduction geometric nonlinearity material nonlinearity and solution of nonlinear equilibrium equations Interactive computer graphics program Packaged with the text is MASTAN2 a MATLAB based program that provides for graphically interactive structure definition linear and nonlinear analysis and display of results Examples The book contains approximately 150 illustrative examples in which all developments of consequence in the text are applied and discussed *Stability Sensitivity of Low-rise Steel-moment Framed Buildings to Hazard-independent Damage* Trey Reynolds Powell, 2016 Structural stability has been the subject of much research in recent years Simply structural stability may be viewed as the ability of the structure's response to be relatively unaffected by perturbations to its system Stability of low rise steel moment framed buildings and their sensitivity to perturbations from significant damage are the focus of this work Perturbations or changes from the normal state of the structural system have the ability to affect the structural response Second order geometric effects imposed through column axial loads and or initial out of plumbness during the construction process are a common perturbation in steel framing systems If the structural members subjected to these effects are damaged through a specific hazard the effective stiffnesses of the members are reduced and the consequence of the individual perturbations is amplified Because such scenarios are feasible during the lifetime of a structure robust methods to investigate structural stability sensitivity to damage and second order geometric effects are desired A stiffness reduction factor is introduced into the analytical finite element formulation of a portal frame to account for hazard independent damage Second order geometric effects are included in this formulation This finite element formulation is created using Mathematica and its formulation is verified against idealized elastic critical buckling load theory Next the formulation is generalized to provide an ability to analyze the elastic buckling load of a wide

range of portal frames The finite element software MASTAN2 and SAP2000 are utilized for verification purposes ABAQUS CAE is chosen to further examine the stability of steel moment frames Several cases of gravity and lateral loads are applied to planar frame models Again the hazard independent damage is introduced to the system in various cases and nonlinear geometric effects are accounted for Results of this study suggest that the response is largely impacted by the amount and location of the hazard independent damage as well as the complexity of the frame system Lastly the study is extended to a three dimensional steel frame system The system is once again perturbed by several cases of nonlinear geometric effects and hazard independent damage Results of this study suggest that stability failure is a high concern in the cases considered
