

Heat Transfer Notes

- Heat (thermal energy) is created by the movement of particles (atoms) that produces heat.
- Heat (thermal energy) is transferred from one object to another when the objects are at different temperatures.
- Thermal energy always moves from warmer to cooler objects.

Conduction	Convection	Radiation
<ul style="list-style-type: none">○ Conduction is the transfer of heat by direct contact (particles collide)○ Conduction occurs most easily in solids and liquids○ Conductors: substances that transfer thermal energy very well○ Example: metals○ Insulators: substances that do not transfer heat very well○ Example: wood, paper, plastic, foam	<ul style="list-style-type: none">○ Convection is the flow of currents in a liquid or gas○ A current is created when the warmer (less dense) material rises forcing the cooler (more dense) material to sink○ Convection is a cycle in nature responsible for most winds and ocean currents.○ Example: Hot water rising in a pool and cold water sinking. The water on top of the pool is warmer, the bottom is cooler.○ Basement in a house is cooler than the attic	<ul style="list-style-type: none">○ Radiation is heat transfer through space by electromagnetic waves○ Radiation can occur in empty space, as well as in solids, liquids and gases.○ Waves such as visible light, infrared, and ultraviolet light are forms of radiation.○ Examples: Heat from a light bulb, microwave oven, getting a sunburn, cooking hamburgers over a charcoal flame
