

external hydrostatic pressure and also the special equipment devised to measure the radial deflections. The description of the combined load testing machine at the Langley Structures Laboratory is also of interest. This machine can apply and measure up to three loads and three moments simultaneously.

On the properties of electrical resistance strain gauges there are investigations of the performance of wire and foil gauges when subjected to oil pressure as well as strain. The gauges recorded strain satisfactorily, the foil gauges under pressures up to 30,000 lb./sq. in., but some unexplained results with the wire gauges need further study. Special gauges for the direct measurement of principal stresses are available commercially but there is here a discussion of the use of a single gauge of conventional type for this purpose. The angle at which the gauge must be set to read either the maximum or minimum principal stress requires a knowledge of the principal stress directions and also of the value of Poisson's ratio for the material under study. For mounting Bakelite type gauges on structural members a special tool is described. It consists of a plunger loaded by air pressure which also contains a heating element; suitable shoes can be made for use on curved surfaces. When a strain gauge of higher sensitivity is needed, the barium titanate ceramic wafer may be used and a paper gives frequency response curves for these gauges. It is shown that, although the sensitivity is constant over the range 20 to 600 cycles per second, there is sufficient variation between gauges to necessitate individual calibration.

In the field of brittle coatings there are two further contributions on the properties of Stress-coat from the Armour Research Foundation. These careful investigations should promote increased interest in the use of this method and this is in fact borne out by the publication of two written discussions on the papers.

Photoelasticity occupies less space than usual in this number of the Proceedings but there is an example of its use for the examination of fillets of such a curvature as to be free from stress concentration. In another paper Neuber's equations are used to show that the distribution of stress at the base of a hyperbolic notch in a round bar subjected to tension, torsion or bending is approximately the same as that for a flat plate. A continuation of this work gives curves for the stress gradient across the narrowed section under the same conditions.

Two papers on electrical analogues are included. One makes use of resistance networks for the study of non-linear problems in vibration and elastic stability and the other represents a mechanical system in terms of inductance, capacity and resistance for the study of transient effects such as those caused by earth shocks generated by explosions and by earthquakes.

There are four other papers. The first describes a method of testing rubbers and plastics under dynamic loading. The sample is placed between two ballistic pendulums, with which striking velocities up to 80 cm./sec. have been reached. Analysis of the results is based on the displacement-time relationship during the impact but it is hoped that more informative results may be obtained by later experiments in which accelerations are to be measured. The second paper discusses methods of tracing the modes of vibration of a vibrating body with a transducer and oscilloscope. The third describes a ballistocardiograph for recording the loads on the body caused by the acceleration of the blood and thus for a study of the action of the heart. The last in this group reviews many of the structural problems confronting the designer of gas turbine engines.—A. F. C. BROWN.

RADIO TELEMETRY. 2nd Edition. M. H. Nichols and L. L. Rauch. Chapman and Hall, London, 1956. 461 pp. Illustrated. 96s.

In the past few years many published papers have shown the use of particular telemetering techniques in solving a wide variety of problems. Indeed, the present state of aeronautical science is witness to the value of these techniques in one field alone. To the user, on the other hand, the complexity of the technology has made it extraordinarily difficult to judge the relative merits of possible systems. This volume which is a critical survey of the whole field of radio telemetering is therefore particularly welcome.

The book itself falls into three sections, dealing respectively with general methods, basic theoretical relationships and practical techniques. A series of appendices, mainly of a theoretical nature, are also included.

The larger part of the book describing methods begins with a brief historical survey of the science. The philosophy of multiplex working and an introduction to the problem of noise follows, and the effect of different methods of modulation on the radio link are discussed. A chapter on transducers is included.

The second section dealing with theory describes mathematically the features of modulation and multiplexing that are of importance in telemetering. Alternative systems are analysed.

The third part includes detailed descriptions of practical systems which have been used, with circuit diagrams and notes on their operation. A chapter on the reduction of data provided by telemetering systems in general is included. The features of radio control links and their properties are also briefly compared with telemetering channels.

The appendices include details of a variety of important mathematical analyses. A typical example is the short section describing the selection of frequencies for multiplex frequency modulation systems to minimise crosstalk. Details of American standards for telemetering apparatus are also given.

The authors of this book stress the importance of designing as a coherent whole an experiment in which telemetering plays a part. Towards this end they have produced a most lucid guide to the design and construction of such telemetering apparatus. Their book is well illustrated by examples, drawings and photographs, and includes a large bibliography drawn mainly, but not entirely, from American sources. Perhaps the most useful parts of the book are those dealing with the fundamental signal-to-noise relationships inherent in different telemetering systems.

Both telecommunication and aeronautical engineers would undoubtedly find much of value in this volume.—H. A. DELL.

VISION. *A Saga of the Sky.* Harold Mansfield. Dwell, Sloan and Price, New York, 1956. 369 pp. Illustrated. \$5.00.

Patriotism is splendid by itself and finest of all when expressed with a deep sincerity. Patriotism allied with the humility which acknowledges that one's own country is not the only significant part of the Earth is one of the roots of Wisdom.

Harold Mansfield writes with admirable sincerity about the aims and achievements of his own country but seems often to overlook the existence of others. He has written the history of the Boeing Airplane Company in a most unusual way—told, as the dust jacket explains, in the technique of fiction. The theme of this story is "Honesty
