Model Of The Visual Cortex:

Models of the Visual Cortex David Rose, Vernon G. Dobson, 1985 A comprehensive and stimulating study which presents the views of 71 leading theorists on the underlying mechanisms and functions of the primary visual cortex *Models of the Visual Cortex* David Rose (Dobson, Vernon G.), 2000 **Models of the Visual System** George K. Hung, Kenneth J. Ciuffreda, 2002-01-31 Over the past thirty years with improvements in optics electronics and computer technology great strides have been made in the quantitative analysis of the visual system A number of books on eye movement research have been written that have dealt with specific aspects of either eye movement control However none of these books provide a comprehensive overview of multiple aspects of the visual system Moreover few of these books contain modeling and detailed quantitative analyses of the visual system Further since the major books are almost ten years old there is a need for an update to include the most recent research findings It is with these considerations in mind that we have carefully compiled this updated comprehensive and quantitative model based edited book on various components of the visual system Some of the best vision scientists in the world in their respective fields have contributed to chapters in this book They have expertise in a wide variety of fields including bioengineering basic and clinical visual science medicine neurophysiology optometry and psychology Their combined efforts have resulted in a high quality book that covers modeling and quantitative analysis of optical neurosensory oculomotor perceptual and clinical systems It includes only those techniques and models that have such fundamentally strong physiological control system and perceptual bases that they will serve as foundations for models and analysis techniques in the future The book is aimed first towards seniors and beginning graduate students in biomedical engineering neurophysiology optometry and psychology who will gain a broad understanding of quantitative analysis of the visual system In addition it has sufficient depth in each area to be useful as an updated reference and tutorial for graduate and post doctoral students as well as general vision scientists **Models of the Visual Cortex** David Rose, Vernon G. Dobson, 1985-01-01 *Large-scale Functional Models of Visual Cortex for Remote Sensing*, 2009 Neuroscience has revealed many properties of neurons and of the functional organization of visual cortex that are believed to be essential to human vision but are missing in standard artificial neural networks Equally important may be the sheer scale of visual cortex requiring almost equal to 1 petaflop of computation In a year the retina delivers almost equal to 1 petapixel to the brain leading to massively large opportunities for learning at many levels of the cortical system We describe work at Los Alamos National Laboratory LANL to develop large scale functional models of visual cortex on LANL's Roadrunner petaflop supercomputer An initial run of a simple region VI code achieved 1 144 petaflops during trials at the IBM facility in Poughkeepsie NY June 2008 Here we present criteria for assessing when a set of learned local representations is complete along with general criteria for assessing computer vision models based on their projected scaling behavior Finally we extend one class of biologically inspired learning models to problems of remote sensing imagery *Computational Maps in the*

Visual Cortex Risto Miikkulainen, James A. Bednar, Yoonsuck Choe, Joseph Sirosh, 2006-01-16 For more than 30 years the visual cortex has been the source of new theories and ideas about how the brain processes information The visual cortex is easily accessible through a variety of recording and imaging techniques and allows mapping of high level behavior relatively directly to neural mechanisms Understanding the computations in the visual cortex is therefore an important step toward a general theory of computational brain theory *A Unified Model of the Structure and Function of Primate Visual Cortex* Eshed Margalit, 2022 Humans have the remarkable capacity to recognize visual objects despite challenging variations in their pose illumination and context This ability depends on the ventral visual stream a series of cortical areas that progressively transforms the signal from the retina into representations of object category location color texture and size Our understanding of the function and development of the ventral visual stream is anchored in the tight coupling between structure and function in the constituent cortical areas in each area neurons are arranged in the cortical sheet according to the visual features they respond most strongly to In the earliest stage of the ventral visual stream neighboring neurons preferentially respond to edges of similar orientations and colors whereas neurons toward the end of the ventral stream cluster together according to their preferred object category e g faces limbs and places Understanding the development and purpose of this functional organization requires the construction of detailed models whose predictions can be evaluated against neural measurements In this dissertation I present topographic deep convolutional neural networks topographic DCNNs as unifying models of neural structure and function throughout the ventral visual stream Topographic DCNNs implement the simple hypothesis that functional organization in the visual cortex can be reproduced by optimizing the parameters of a neural network to perform a challenging visual task while keeping local populations of neurons correlated with one another I find that topographic DCNNs are able to reproduce functional organization in both early and later stages of the ventral visual stream that this brain model correspondence is strongest for more biologically plausible learning algorithms and that topographic DCNNs can be used to predict how changes to visual inputs during development will affect cortical map formation The success of topographic DCNNs in the prediction of the functional organization of the primate ventral visual stream implies the existence of simple unifying principles for the development of those regions and serves as a foundation from which increasingly accurate models of visual processing can be constructed *A Neural Network Model of the Primary Visual Cortex* Alan Spara, 2007 Many problems in modern computing require a visual component That is to say it is fairly common for applications to have a need to see their environments These applications will typically employ techniques designed specifically to solve the particular task needed for the application and have little or no relation to the human visual system Humans generally do not have difficulty interpreting the world around us When traveling through known environments we can easily recognize particular walls doors and other objects in our view We are not confused by the huge number factors that can complicate an image The generalization and robustness of the human system would provide a huge

benefit to any system that requires more advanced vision than is capable with the ad hoc methods developed previously. If the underlying principles that make the human visual system so powerful can be identified and implemented programmatically, then a machine could reap the benefits obtained by humans. The purpose of this thesis is to demonstrate that a visual system modeled after the human visual system will be robust and accurate enough to solve real world problems and to be useful in a non trivial application. By developing neural networks that directly model the most primitive image processing cells of the human visual system, a platform can be built on which advanced vision systems can be developed.

Motion Model in the Primary Visual Cortex Itay Sherman, 1997 Circuits in the Brain Charles Legéndy, 2009-04-20 Dr Charles Legéndy's Circuits in the Brain: A Model of Shape Processing in the Primary Visual Cortex is published at a time marked by unprecedented advances in experimental brain research which are however not matched by similar advances in theoretical insight. For this reason the timing is ideal for the appearance of Dr Legéndy's book which undertakes to derive certain global features of the brain directly from the neurons. Circuits in the Brain with its relational firing model of shape processing includes a step by step development of a set of multi neuronal networks for transmitting visual relations using a strategy believed to be equally applicable to many aspects of brain function other than vision. The book contains a number of testable predictions at the neuronal level, some believed to be accessible to the techniques which have recently become available. With its novel approach and concrete references to anatomy and physiology the monograph promises to open up entirely new avenues of brain research and will be particularly useful to graduate students, academics and researchers studying neuroscience and neurobiology. In addition, since Dr Legéndy's book succeeds in achieving a clean logical presentation without mathematics and uses a bare minimum of technical terminology, it may also be enjoyed by non scientists intrigued by the intellectual challenge of the elegant devices applied inside our brain. The book is uniquely self contained with more than 120 annotated illustrations, it goes into full detail in describing all functional and theoretical concepts on which it builds.

Region Detection Using a Model of Visual Cortex in the Cat John R. Porterfield, 1985 **A Functional Model for Primary Visual Cortex** Nastaran Hesam Shariati, 2012 *A Model for the Development of Neurons in Visual Cortex* L. N. Cooper, BROWN UNIV PROVIDENCE RI CENTER FOR NEURAL SCIENCE., 1984. The object of our research is to find principles of development and organization of neural networks that can account both for experimental data on the cellular level and when applied to large numbers of neurons that receive sensory and/or interneuronal information for various higher level systems properties. Networks of neurons already have been constructed that can organize themselves to display some cognitive properties. Although these are still primitive compared to what animals or even machines in some cases can presently do, it is significant that these networks are self organizing, that the global cognitive properties are the result of local modifications of the network components, learning so to speak on a cellular level. This learning comes about through the modification of synaptic junctions, connections between neurons. One crucial hypothesis concerns the form of this synaptic

modification by applying them to the development of selectivity and ocular dominance in cat visual cortex where much experimental data has been obtained in the last twenty years This leads to a theory of synaptic evolution based on sets of coupled non linear stochastic differential equations Analysis and computer simulations show this theory is in good agreement with classical experimental results In addition we obtain some new predictions that can be tested

A Silicon Model of the Primary Visual Cortex: Representing Features Through Stochastic Variations Paul A. Merolla,2006 The design principle used by the bump chip can help engineers build complex systems with imprecise components Our chip exploits component variability to obtain two traits that set it apart from every other man made system to date 1 its functional architecture orientation selectivity is not specified prior to fabrication and 2 the architecture s scaffold is innate to each chip and exists as an indelible imprint Therefore our chip attains all of the benefits of a self organizing learning system without having to go through the tedious process of learning

Modeling and Simulation. II. Specificity Models for Visual Cortex Development Alan B. Saul,J. D. Daniels,PSYCHIATRIC UNIVERSITY CLINIC BERN (Switzerland) BRAIN RESEARCH INST.,1986 Observations of developmental plasticity in the visual cortex of cats have inspired a number of theoretical models These models attempt to mimic the development of response specificity We review the assumptions upon which one can build models of the visual cortex The anatomical layout usually consists of excitatory afferents from the lateral geniculate nucleus with intracortical inhibition among a population of cells The degrees of convergence of the afference and divergence of the inhibition are some of the more important considerations which distinguish different models Synaptic modifications rules lie at the heart of these theories Modification is usually of the Hebbian type with synaptic strengths changing as some function of the product of pre and postsynaptic activity A successful model not only alters synapses to generate specificity in single units but simultaneously produces a cortical network which is stable and which mimics the behavior of experimental population

Development of an Integrated Model of Primary Visual Cortex Benjamin Selby,2016 Network level models of visual processing have potentially important insights for applications such as computer vision and robotics Primary visual cortex is a key stage of visual processing with involvement in many circuits proposed for these applications including motion tracking object recognition and control of eye movements However no model of V1 to date has captured the complete set of observed behaviour in a large scale model Linear kernel methods with threshold and divisive non linearities can reproduce classical receptive field behaviour but not the full range of non classical behaviours The stabilized supralinear network SSN provides a simple scheme of lateral interactions that produce a wealth of observed V1 behaviour not previously captured with linear kernel methods However the SSN is restricted in stimulus selectivity and is not pixel computable limiting its utility for real world applications Integrating

a linear kernel model with the SSN resulted in a model that is pixel computable and produces a wide range of classical and non classical behaviour With further development this network model will be usable in visual processing circuits The SSN was also expanded to use binocular stimuli Using an optimization procedure SSN parameters were found that produce interocular transfer of suppression in excitatory units but not inhibitory ones The lack of interocular transfer in inhibitory units may indicate that an alternate inhibition stabilization scheme is more biophysically realistic Mammalian visual perception is enabled not only by neural processing but also by precise eye movements which allow for efficient scanning of the environment This thesis describes the requirements for a robot that can orient cameras with the same dynamics as macaque monkey eyes as well as a camera system that reproduces macaque visual acuity
