

3. Compact Disc Features

1) **Superior Sound Quality**

- To maintain master recorder quality, the information on the disc is recorded with 16-Bit linear quantization.
- To improve recording density (playback time), eight to fourteen bit modulation (EFM) is used. This allows 2 channel playback for 74 minutes.
- To realize stable data reproduction a special error correcting code called the Cross Interleave Reed-Solomon code (CIRC) is used.

2) **Virtually Indestructable**

- The non-contact laser playback system allows repeated use with no degradation in quality.
- The plastic coating over the signal information protects it against scratches, dirt and fingerprints.

3) **Small Size**

The small size allows for easy, compact storage.

4) **Random Access**

The control information recorded on the disc allows random access and character display such as names of tunes, artists etc.

4. PCM Features

Using a PCM system for Audio reproduction has certain advantages.

1. Not affected by noise of the recording medium. The digital system only has to detect two types of signals (0's and 1's). This is much easier than trying to detect the infinite number of possible amplitudes and frequencies of an analog signal.
2. Eliminates effects of uneven rotation of the playback equipment due to a quartz controlled reading clock.
3. Able to Correct Errors.
Besides including the recorded signal, the digital data has error correction information. This allows the digital circuit to calculate what the information should be if the music signal can not be read properly because the disc surface is marred by dirt or scratches.

5. PCM Process for CD

The PCM process has several fundamental steps regardless of whether the application is satellite data transmission or simply audio reproduction. A general description is given of the recording and playback procedures followed by an explanation of each step.
