Caldera Volcanism Joachim Gottsmann, Joan Marti, 2011-09-22 This volume aims at providing answers to some puzzling questions concerning the formation and the behavior of collapse calderas by exploring our current understanding of these complex geological processes Addressed are problems such as How do collapse calderas form What are the conditions to create fractures and slip along them to initiate caldera collapse and when are these conditions fulfilled How do these conditions relate to explosive volcanism Most products of large caldera forming eruptions show evidence for pre eruptive reheating Is this a pre requisite to produce large volume eruptions and large calderas What are the time scales behind caldera processes How long does it take magma to reach conditions ripe enough to generate a caldera forming eruption What is the mechanical behavior of magma chamber walls during caldera collapse Elastic viscoelastic or rigid Do calderas form by underpressure following a certain level of magma withdrawal from a reservoir or by magma chamber loading due to deep doming underplating or both How to interpret unrest signals in active caldera systems How can we use information from caldera monitoring to forecast volcanic phenomena In the form of 14 contributions from various disciplines this book samples the state of the art of caldera studies and identifies still unresolved key issues that need dedicated cross boundary and multidisciplinary efforts in the years to come International contributions from leading experts Updates and informs on all the latest developments Highlights hot topic areas and identifies and analyzes unresolved key issues

Design of Rock Socketed Drilled Shafts Jamal Nusairat, Robert Y. Liang, Richard L. Engel, 2006 This project was aimed at evaluating and developing design methods for laterally loaded drilled shafts socketed in rock Five lateral load tests on rock socketed drilled shafts with full range of instrumentation were conducted in Ohio Detailed instrumentation included the use of vibrating wire strain gages inclinometers dial gages and load cells P y curves representing site specific lateral shaft rock interaction were deduced from strain data Field testing included the use of a borehole pressuremeter dilatometer to obtain measurements that were correlated with rock mass strength and deformation parameters as well as with p y curves A comparison was made between the baseline p y curves deduced from strain data of lateral load tests the p y curves predicted by using Reese s interim criterion and the p y curves from the pressuremeter tests in rock A new hyperbolic p y criterion for rock is proposed based on the field test data and extensive theoretical work Validation of the proposed p y criterion of rock was carried out by comparing the predictions of shaft deflections and bending moments using the hyperbolic p y criterion against actual lateral load tests results Based on the findings of this study a complete solution for the design of drilled shafts socketed in rock or intermediate geomaterials under lateral loads is provided
