Progress in Solid State Chemistry Howard Reiss, J. O. McCaldin, 1971

Progress in Physical Chemistry Volume 4 Klaus Funke, 2011-11-24 This fourth volume of the series Progress in Physical Chemistry is a collection of mini review articles written by those who were project leaders and members of the Collaborative Research Centre SFB 458 of the German Research Foundation DFG. The articles are based on ten years of intense coordinated research and report particularly on the scientific progress made at SFB 458 since 2005. Their common theme is the study of ionic motion in disordered materials over wide scales in space and time. The mini reviews thus address key questions in the rapidly developing field of SOLID STATE IONICS, a discipline which has its roots in the physics and chemistry of solids and is now a thriving branch of materials science and engineering. In the materials studied, the dynamics of the mobile ions are determined by disorder and interaction. This complicated many particle problem constitutes an area of basic research in its own right. At SFB 458 it has been tackled on complementary routes, i.e. by synthesis of new disordered electrolytes by advanced experimental techniques and by numerical simulations and model concepts. Substantial progress has thus been made in developing a coherent view and a new understanding of the ionic motion in materials with disordered structures.

Progress in Catalyst Deactivation J.L. Figueiredo, 2012-12-06 Most catalysts used in the chemical and petrochemical industries are strongly affected by one or another form of deactivation leading to poor performances and reduced life. The increasing number of scientific communications devoted to the subject in recent years and culminating with an International Symposium held in Antwerp in October 1980 is a measure of the interest it arouses in both the industrial and academic communities. A stage has been reached whereby it was thought that a NATO Advanced Study Institute on Catalyst Deactivation might be fruitful in establishing the state of the art and in stimulating a more systematic research on the phenomenon. Such a meeting was held in Lagos, Portugal from 18 to 29 May 1981. The purpose of the Institute was to present and discuss in a didactic and systematic way the various processes that lead to catalyst deactivation, namely coking, poisoning and solid state transformations, and at the same time to promote the exchange of ideas and experiences among the participants drawn from industry and university. The lectures presented at the Institute are collected in this volume, with the exception of Dr L. L. Hegedus' Catalyst Poisoning, which has been previously published in *Catalysis Reviews: Science and Engineering* 23:377-476 (1981).

Treatise on Solid State Chemistry N. Hannay, 2012-12-06 The last quarter century has been marked by the extremely rapid growth of the solid state sciences. They include what is now the largest subfield of physics and the materials engineering sciences have likewise flourished. And playing an active role throughout this vast area of science and engineering have been very large numbers of chemists. Yet even though the role of chemistry in the solid state

sciences has been a vital one and the solid state sciences have in turn made enormous contributions to chemical thought solid state chemistry has not been recognized by the general body of chemists as a major subfield of chemistry Solid state chemistry is not even well defined as to content Some for example would have it include only the quantum chemistry of solids and would reject thermodynamics and phase equilibria this is nonsense Solid state chemistry has many facets and one of the purposes of this Treatise is to help define the field Perhaps the most general characteristic of solid state chemistry and one which helps differentiate it from solid state physics is its focus on the chemical composition and atomic configuration of real solids and on the relationship of composition and structure to the chemical and physical properties of the solid Real solids are usually extremely complex and exhibit almost infinite variety in their compositional and structural features
