Networks And Algorithms:

Networks and Algorithms Alan Dolan, Joan Aldous, 1994-03-08 The authors provide a comprehensive introduction to this topic and its many applications Detailed solution procedures usually in the form of an algorithm are given to a wide range of central network problems There is also a discussion of the time complexity of algorithms and the theory of NP completeness An early chapter provides the basic graph theory required for a study of networks The presentation clarity and arrangement of the material make it ideal for independent study as well as for use with conventional teaching Algorithms are worked through step by step and problems with fully worked solutions are regularly provided to enable students to test and reinforce their learning

Graphs, Networks and Algorithms Dieter Jungnickel, 2013-06-29 From the reviews of the German edition Combinatorial optimization along with graph algorithms and complexity theory is booming This book treats the most prominent problems which are polynomially solvable The Traveling Salesman Problem is discussed as a paradigm of an NP complete problem The text is well written most exercises are quite enlightening and the hints are clear Algorithms are described very thoroughly The list of references is impressive and gives good guidance for further reading The book can be recommended to beginners as an introductory text as well as for research and industry as a reference OPTIMA In this corrected 2nd printing of the first edition the author has made some small modifications some minor mistakes were corrected and updates to the bibliography provided

Survivable Networks Ramesh Bhandari, 1999 Survivable Networks Algorithms for Diverse Routing provides algorithms for diverse routing to enhance the survivability of a network It considers the common mesh type network and describes in detail the construction of physically disjoint paths algorithms for diverse routing The algorithms are developed in a systematic manner starting with shortest path algorithms appropriate for disjoint paths construction Key features of the algorithms are optimality and simplicity Although the algorithms have been developed for survivability of communication networks they are in a generic form and thus applicable in other scientific and technical disciplines to problems that can be modeled as a network A notable highlight of this book is the consideration of real life telecommunication networks in detail Such networks are described not only by nodes and links but also by the actual physical elements called span nodes and spans The sharing of spans the actual physical links by the network logical links complicates the network requiring new algorithms This book is the first one to provide algorithms for such networks Survivable Networks Algorithms for Diverse Routing is a comprehensive work on physically disjoint paths algorithms It is an invaluable resource and reference for practicing network designers and planners researchers professionals instructors students and others working in computer networking telecommunications and related fields

Programming in Networks and Graphs Ulrich Derigs, 1988 Network flow and matching are often treated separately in the literature and for each class a variety of different algorithms has been developed These algorithms are usually classified as primal dual primal dual etc The question the author addresses in this work is that of the existence of a common combinatorial principle which might be inherent in all those apparently different approaches It is shown that all common network flow and matching algorithms implicitly follow the so called shortest augmenting path This can be interpreted as a greedy like decision rule where the optimal solution is built up through a sequence of local optimal solutions The efficiency of this approach is realized by combining this myopic decision rule with an anticipant organization The approach of this work is organized as follows For several standard flow and matching problems the common solution procedures are first reviewed It is then shown that they all reduce to a common basic principle that is they all perform the same computational steps if certain conditions are set properly and ties are broken according to a common rule Recognizing this near equivalence of all commonly used algorithms the question of the best method has to be modified all methods are only different implementations of the same algorithm obtained by different views of the problem
