Whitcombe, 2008-02-03 Enhanced public awareness of microbiological issues and increased governmental regulation have ensured that microbiology and bacteriology remain important from the academic laboratory to a broad range of industrial environments Since the techniques used in bacteriology vary widely and have advanced rapidly of late it has become increasingly desirable to gather a collection of up to date protocols from a comprehensive range of disciplines into a single volume Diagnostic Bacteriology Protocols thus aims to provide a wide variety of up to date protocols for the identification and differentiation of bacteria from pure or mixed cultures and for the study of bacteria at the genus through to subspecies levels In addition we aim to provide methods covering a range of complexities some requiring little or no special equipment others exploiting recent advances in sophisticated instrumentation or novel nucleic acid based technology We also present techniques to study a variety of aspects of bacteria from the features of whole cells and their growth through their enzyme activities and structural components to nucleic acid based analysis *Foundations in Microbiology' 2007 Ed. Pathogenic and Pandemic Vibrio Parahaemolyticus Pendru Raghunath,Iddya Karunasagar,Indrani

Karunasagar,2016-08-15 *Vibrio parahaemolyticus* is a gram negative halophilic bacterium that occurs in the coastal and estuarine environments worldwide and is implicated in several cases of seafood born gastroenteritis around the globe However not all strains of *V parahaemolyticus* are pathogenic Clinical isolates of *V parahaemolyticus* most often produce either the thermostable direct haemolysin TDH or TDH related haemolysin TRH encoded by *tdh* and *trh* genes respectively A pandemic clone of O3 K6 which was first detected in Kolkata India has been responsible for many outbreaks in Asia and the USA With the emergence of pandemic clone of *V parahaemolyticus* this organism has assumed significance Although most of the *V parahaemolyticus* outbreaks are invariably related to seafood consumption pathogenic strains are rarely isolated from seafood Virulent strains producing TDH or TRH and the pandemic clone which is responsible for most of the outbreaks that have occurred after 1996 have been rarely isolated from seafood and other environmental samples This could be due to the occurrence of pathogenic strains in the estuarine environment at a lower level compared to non pathogenic strains Another reason can be that the pathogenic stains are more sensitive to dystropic conditions in the aquatic environment and rapidly become non culturable Similarity in growth kinetics between virulent and non virulent strains also made the isolation of virulent strains from the aquatic environment difficult Several studies were done to determine the factors responsible for an increased virulence and persistence of pandemic clone However none of those studies were conclusive Several researchers have proposed various genetic markers for specific detection of pandemic clone of *V parahaemolyticus* But many of those genetic markers were found to be unreliable Recently seven genomic islands VPai 1 to VPai 7 unique to pandemic clone were identified This Research Topic is dedicated to improve our current understanding of ecology pathogenesis and detection of pathogenic and pandemic clone of *V parahaemolyticus* and will also strive to identify areas of future development ASM News ,1990 *Cytobios* ,1989 **Methods in Phytobacteriology** Z.
