Methods Of Dynamic And Nonsmooth Optimization:

Methods of Dynamic and Nonsmooth Optimization Frank H. Clarke, 1989-01-01 Presents the elements of a unified approach to optimization based on nonsmooth analysis a term introduced in the 1970 s by the author who is a pioneer in the field Based on a series of lectures given at a conference at Emory University in 1986 this volume presents its subjects in a self contained and accessible manner The topics treated here have been in an active state of development Focuses mainly on deterministic optimal control the calculus of variations and mathematical programming In addition it features a tutorial in nonsmooth analysis and geometry and demonstrates that the method of value function analysis via proximal normals is a powerful tool in the study of necessary conditions sufficient conditions controllability and sensitivity analysis The distinction between inductive and deductive methods the use of Hamiltonians the verification technique and penalization are also emphasized

Nonsmooth Dynamic Optimization of Systems with Varying Structure Mehmet Yunt, Massachusetts Institute of Technology. Department of Mechanical Engineering, 2011 In this thesis an open loop numerical dynamic optimization method for a class of dynamic systems is developed The structure of the governing equations of the systems under consideration change depending on the values of the states parameters and the controls Therefore these systems are called systems with varying structure Such systems occur frequently in the models of electric and hydraulic circuits chemical processes biological networks and machinery As a result the determination of parameters and controls resulting in the optimal performance of these systems has been an important research topic Unlike dynamic optimization problems where the structure of the underlying system is constant the dynamic optimization of systems with varying structure requires the determination of the optimal evolution of the system structure in time in addition to optimal parameters and controls The underlying varying structure results in nonsmooth and discontinuous optimization problems The nonsmooth single shooting method introduced in this thesis uses concepts from nonsmooth analysis and nonsmooth optimization to solve dynamic optimization problems involving systems with varying structure whose dynamics can be described by locally Lipschitz continuous ordinary or differential algebraic equations The method converts the infinite dimensional dynamic optimization problem into an nonlinear program by parameterizing the controls Unlike the state of the art the method does not enumerate possible structures explicitly in the optimization and it does not depend on the discretization of the dynamics Instead it uses a special integration algorithm to compute state trajectories and derivative information As a result the method produces more accurate solutions to problems where the underlying dynamics is highly nonlinear and or stiff for less effort than the state of the art The thesis develops substitutes for the gradient and the Jacobian of a function in case these quantities do not exist These substitutes are set valued maps and an elements of these maps need to be computed for optimization purposes Differential equations are derived whose solutions furnish the necessary elements These differential equations have discontinuities in time A numerical method for their solution is proposed based on state event location algorithms that

detects these discontinuities Necessary conditions of optimality for nonlinear programs are derived using these substitutes and it is shown that nonsmooth optimization methods called bundle methods can be used to obtain solutions satisfying these necessary conditions Case studies compare the method to the state of the art and investigate its complexity empirically

Nonsmooth Optimization: Analysis And Algorithms With Applications To Optimal Control Marko M Makela,Pekka Neittaanmaki,1992-05-07 This book is a self contained elementary study for nonsmooth analysis and optimization and their use in solution of nonsmooth optimal control problems The first part of the book is concerned with nonsmooth differential calculus containing necessary tools for nonsmooth optimization The second part is devoted to the methods of nonsmooth optimization and their development A proximal bundle method for nonsmooth nonconvex optimization subject to nonsmooth constraints is constructed In the last part nonsmooth optimization is applied to problems arising from optimal control of systems covered by partial differential equations Several practical problems like process control and optimal shape design problems are considered **Algorithms for Solving Nonlinear Programming Problems with Noisy Data** Michael Hintermüller,1998 **Proceedings of the Steklov Institute of Mathematics** ,2000 *Hybrid Systems* ,1996 Vols for 1996 consist of papers presented at the 4th International Conference on Hybrid Systems
